

Science & Engineering Fairs: A Practical Approach

Dr. Rita Peterson
AFRL Sensors Directorate
Senior Research Physicist
(937) 904-9657

Mr. Bob Gemin
WPAFB Educational Outreach
Engineering Specialist
(937) 656-2273

**When Somebody
Says “Science
Fair” . . .**

**What’s the first
thought that pops
into your head???**

A Science Fair Is...

- ▮ **More work!**
- ▮ **Required for a grade**
- ▮ **Only for geeks/nerds**
- ▮ **Confusing!!**
- ▮ **Fear of unknown!!!**

What should you think?

How you'll feel after the Science Fair:

- ▮ I'm proud of myself for doing a great job!
- ▮ It was fun to be in charge of my own project.
- ▮ I showed Mom and Dad what I can really do.
- ▮ Wow - I never realized _____!
- ▮ I want to learn more about _____.

*There are many reasons
to participate! What's
yours???*

**Computers? Cell phones?
Rockets to Saturn, probes to the
ocean floor, GPS systems,
gameboys, X-boxes?**

**All developed by scientists and
engineers.**

A Science Fair Project Is An Opportunity

- ▮ Explore new things
- ▮ Develop valuable skills
- ▮ Improve self- confidence
- ▮ Meet interesting people
- ▮ Sometimes win prizes/money

A Science Fair Project Involves Many Subjects

- ▮ Science
- ▮ Math
- ▮ Reading
- ▮ English/writing
- ▮ Art/design
- ▮ Social Studies
- ▮ Music/sports/etc.

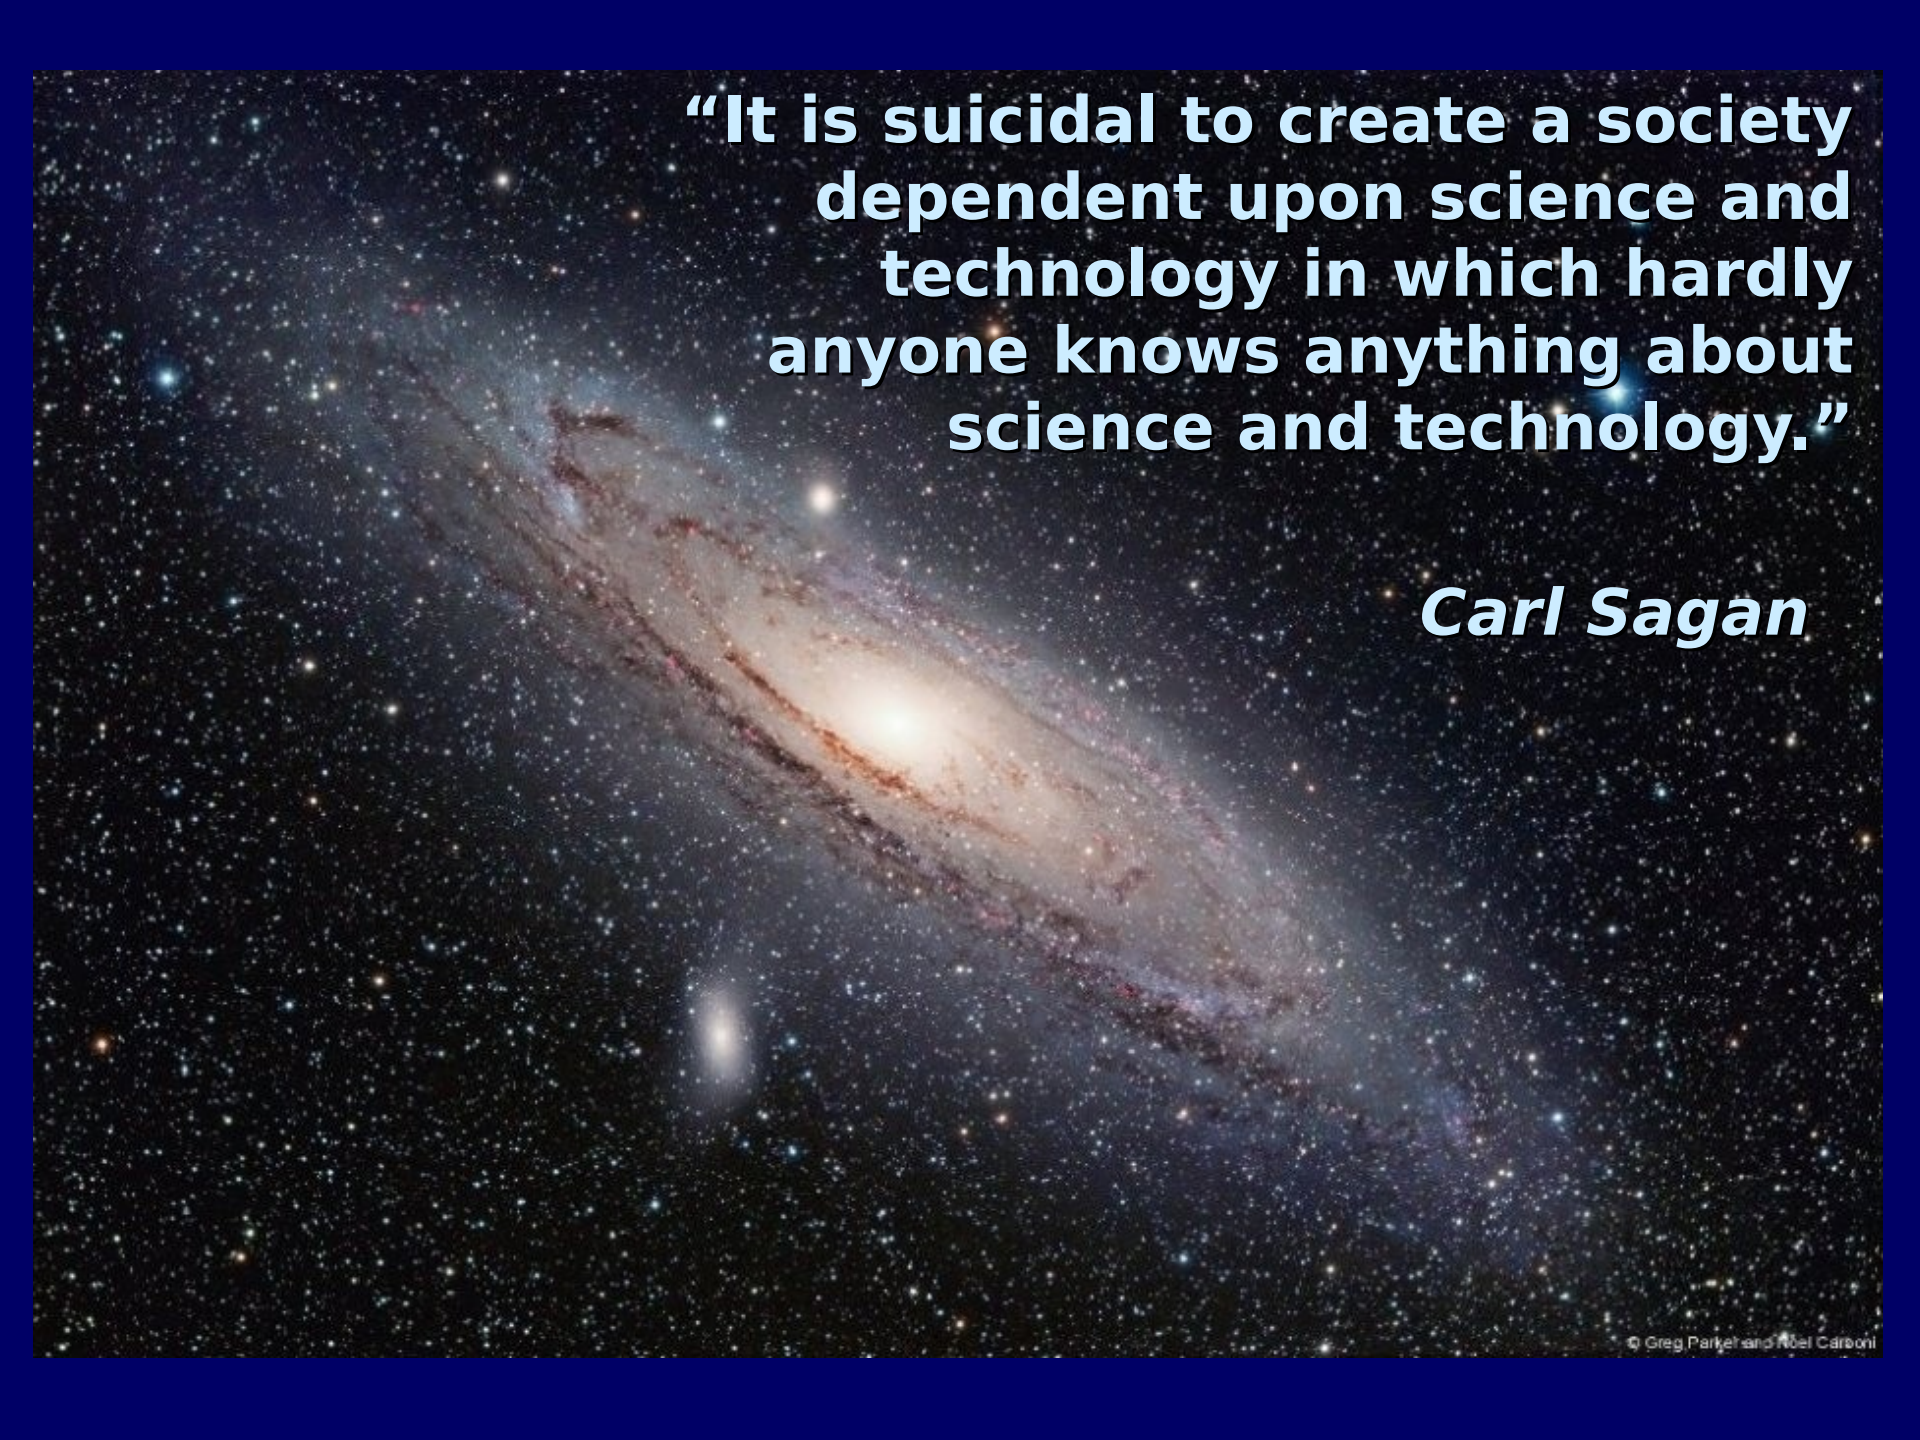

A Science Fair Project Develops Useful Skills

- ▮ Using the scientific method
- ▮ Creative problem solving
- ▮ Critical thinking skills
 - fact vs. opinion
 - logic vs. assumption
- ▮ Time and project management
- ▮ Communication - writing and speaking
- ▮ Efficient, judicious use of information
- ▮ Confidence, poise and thinking on your feet.

Every human being can benefit from these

**“It is suicidal to create a society
dependent upon science and
technology in which hardly
anyone knows anything about
science and technology.”**

Carl Sagan

The Science Fair Recipe

QUESTION

RESEARCH

HYPOTHESIS

PROCEDURE

EXPERIMENT

RESULTS

ANALYSIS

CONCLUSION

**Scientific
Method**

How is Science Done in the Real World?

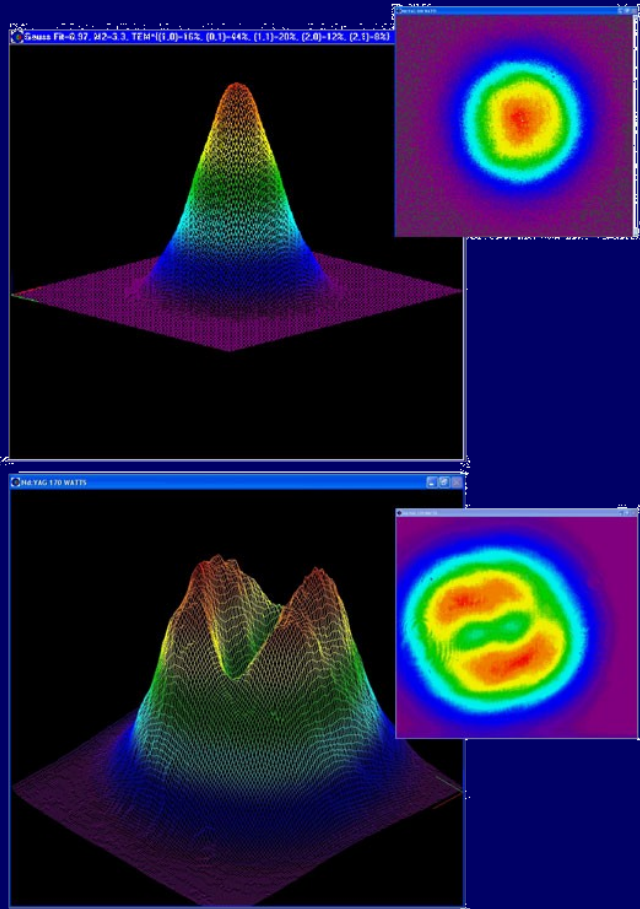

- ▮ No one is the lone ranger
 - ▮ Everyone has help: colleagues, mentors, technicians, etc.
 - ▮ Crediting the work of others is essential
- ▮ No idea is entirely original
 - ▮ Everything builds upon what came before
 - ▮ Much valuable research is incremental
- ▮ We can't always formulate a specific
- ▮ Experiments rarely work the first time
- ▮ "Failures" really can be valuable
- ▮ Communication is as important as results

**Science is a way of finding things out.
It's a way of testing what's real. It's
what Richard Feynman called "A way of
not fooling ourselves."**

Developing a Question

A good science fair topic is:

- **Interesting and exciting**
- **Manageable in scope**
- **Doable with available resources**
- **Experimental**
- **Quantifiable (what will you plot?)**
- **Original and creative (what can you do that is different?)**

Getting ideas

Start with a list

INTERESTS	KNOWLEDGE/ SKILLS	MENTOR	RESOURCES
BASKETBALL	MATH	ROY - PAINTER	VIDEO CAMERA
FANTASY/RPGs	COMPUTER GAMES	JANE - GARDENING	BLOOD PRESSURE MONITOR
AIRPLANES	BASKETBALL	BOB - ELECTRONICS	THERMOMETERS
WEATHER	WOODWORKING	SALLY - NURSE	FISH TANK

Getting ideas

Start with a list

INTERESTS	KNOWLEDGE/ SKILLS	MENTOR	RESOURCES
BASKETBALL	MATH	ROY - PAINTER	VIDEO CAMERA
FANTASY/RPGs	COMPUTER GAMES	JANE - GARDENING	BLOOD PRESSURE MONITOR
AIRPLANES	BASKETBALL	BOB - ELECTRONICS	THERMOMETERS
WEATHER	WOODWORKING	SALLY - NURSE	FISH TANK

Surf the web

Talk with a possible mentor

Think of your favorite science lesson

Daydream: what makes you wonder?

An example:

How high will a basketball bounce when inflated to different pressures?

Doing Research

- ▮ **Commit to documenting your work**
 - ▮ **Record everything, even if it seems inconsequential**
 - ▮ **No one ever puts enough detail in their notebook**
- ▮ **Research underlying scientific principles**
 - ▮ **Informs educated guesses to answer your question**
 - ▮ **Helps with design of experiment, equipment**
- ▮ **Internet searches are great... but don't forget books, journals, and people**
 - ▮ **More on this later!!**
 - ▮ **Make note of sources for proper attribution**

Get a notebook!!

STEP #2 - RESEARCH

Forming a Hypothesis

The hypothesis rewords your question in a way to help you do your experiment

- ▮ It is not a wild or uninformed guess
- ▮ It should be based upon what you already know about your question
- ▮ Be prepared to explain it
- ▮ Engineering projects may be a special case

STEP #3 -

Procedure/Experiment - Design Is Critical

Measure something that can be quantified

- What are you measuring?**
- How will you collect the data?**
 - equipment**
 - method**
- How many data points do you need?**
- How many times will you repeat the experiment?**
- What is the error/uncertainty in the data?**

STEP #4, 5 -

Getting Results

- ▮ The better you prepare, the more straightforward the test
- ▮ Follow your procedure carefully and consistently
- ▮ Record everything - even failures
 - ▮ Record all experimental conditions
 - ▮ Record observations like noises/smells
 - ▮ Take pictures of test setup
- ▮ Document anything that might have an impact (someone opened an outside door and let cold air in)

STEP #6 - RESULTS

“It is a capital mistake to theorize before one has data. Insensibly one begins to twist facts to suit theories, instead of theories to suit facts.”

***Sherlock Holmes in
Arthur Conan Doyle's
A Scandal in Bohemia (1891)***

Analysis - one step at a time

Start by plotting your data

- Is the plot linear? What are the slope, intercepts, max and min values? What do these mean?
- How do plots of different runs compare?
- Plot the same data different ways to highlight different observations
- Use statistics if helpful to combine data
- Spreadsheets are powerful tools - but make sure you know how to plot data by hand first!!!

Example 1 - obvious

Bounce height for various basketball pressures and drop heights

1 Meter 2 Meter 3 Meter 4 Meter

Example 2

**Bounce ratio vs. ball pressure
for various drop heights**

—◆— 1 Meter —■— 2 Meter —▲— 3 Meter —×— 4 Meter

Example 3

**Bounce ratio vs. drop height
for various ball pressures**

Error / Uncertainty

- ▮ **“Error” doesn’t mean that you made a mistake**
 - ▮ **often factors in environment that can’t be controlled**
 - ▮ **weigh impact of error vs. difficulty to control**
 - ▮ **identify error sources in your analysis**
- ▮ **Every measuring device has limits (precision)**
- ▮ **Every subject of study will have different variation**

STEP #6 - ANALYSIS

Conclusions

- ▮ **Don't just repeat yourself**
- ▮ **Summarize key points from your results**
 - ▮ **How accurate are they?**
 - ▮ **What is their meaning or significance?**
- ▮ **Focus on answering your question/hypothesis**
 - ▮ **Your project is not a failure if your hypothesis was wrong**
 - ▮ **If your hypothesis is disproven, offer an explanation**
 - ▮ **Now that you have an answer, what is it good for?**
- ▮ **How might you do things differently, or expand upon your results? Suggest future tests, or related projects**

Avoid Common Mistakes

- ❑ Sample size too small - need more trials
- ❑ More than 1 uncontrolled variable at a time
- ❑ Nothing readily quantifiable in project
- ❑ Scope too broad - can't cover parameter space with time, resources available
- ❑ Scope too narrow/project too simple
- ❑ Plots not labelled right, not explained, wrong type, too many
- ❑ Conclusions not explained
- ❑ Display contains errors or is too flashy

Making the Most of Mentors (including parents):

- ▮ Find mentors with ability, expertise to meet your needs
 - ▮ relatives, neighbors, friends
 - ▮ teachers, coaches
 - ▮ internet contacts (ask your parents first)
- ▮ Be respectful of their time
- ▮ Be prepared with specific questions
- ▮ Listen to them!
- ▮ Arrange to meet again; ask for more leads
- ▮ Thank and acknowledge them

I'd be glad to

Scientists and engineers enjoy sharing what they love with young people . . . like YOU!

Prepare For Presentation

- ▮ **Prepare and practice your presentation**
 - ▮ **Follow the scientific method outline**
 - ▮ **Explain what you did and why, what you saw, and what it means**
 - ▮ **Identify what is original about your project**
 - ▮ **Use your poster as a cheat sheet**
 - ▮ **Practice on friends, parents, etc.**
- ▮ **Anticipate likely questions**
 - ▮ **Research the answers**
 - ▮ **Make note cards as reminders**
 - ▮ **Practice/memorize them**

Typical Questions

- ▮ Where did the idea for this project come from?
- ▮ What did you learn from your research?
- ▮ What were the most important sources used in your research?
- ▮ How much time did you spend on the project? What took most of your time?
- ▮ Where did items used in your project come from?
- ▮ How many times did you run the experiment with each configuration?
- ▮ Did you use any statistics such as averaging?
- ▮ How constant were conditions during experiments?
- ▮ What would you do differently, or in addition?

Selling Yourself - Use PIE!

- ▮ **Performance** - already covered
- ▮ **Image** - impression you give in appearance, actions
 - ▮ Help the judges see their history in your future
 - ▮ Speak, act, dress like a young professional
 - ▮ Show them you enjoy what you are doing; tell stories, share extra things you have learned
 - ▮ Ask questions - play to their expertise
- ▮ **Exposure** - grab attention with your display
 - ▮ But take note of any rules and restrictions
 - ▮ Make sure it is free of errors, typos, etc.

Did We Mention “Having Fun”?

- ▮ People throughout history have experimented with science and engineering “for fun”
- ▮ Imagine getting paid for doing something you enjoy doing
- ▮ To avoid stress: start your project early, be ready... then kick back and enjoy

WANT TO SEE YOU
